

WATER POLLUTION

By 2 E Class. Secondary school

Planning work in the classroom

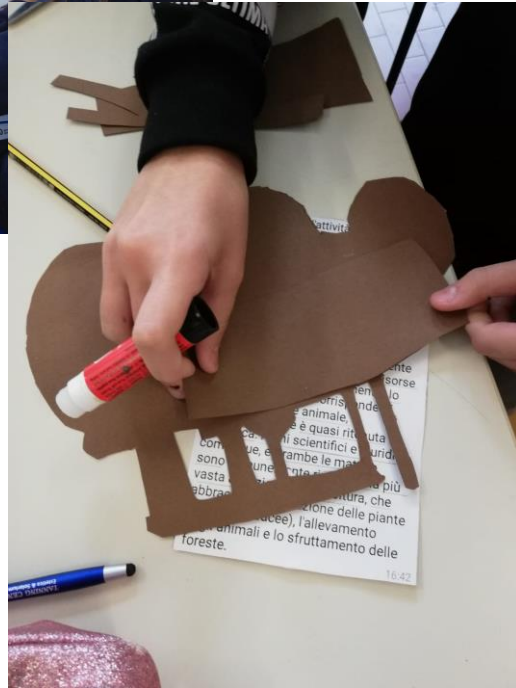

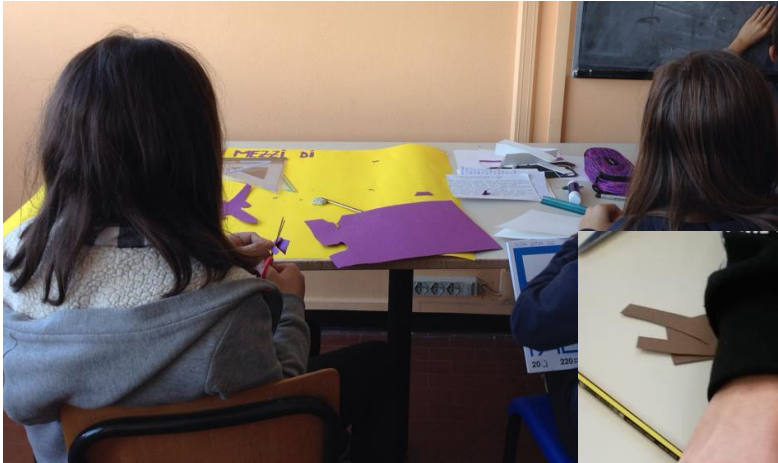

We decided to study water pollution, one of the major environmental problems. We divided the class in 7 groups: every group did a search and made posters about a particular aspect of this issue.

Teamwork

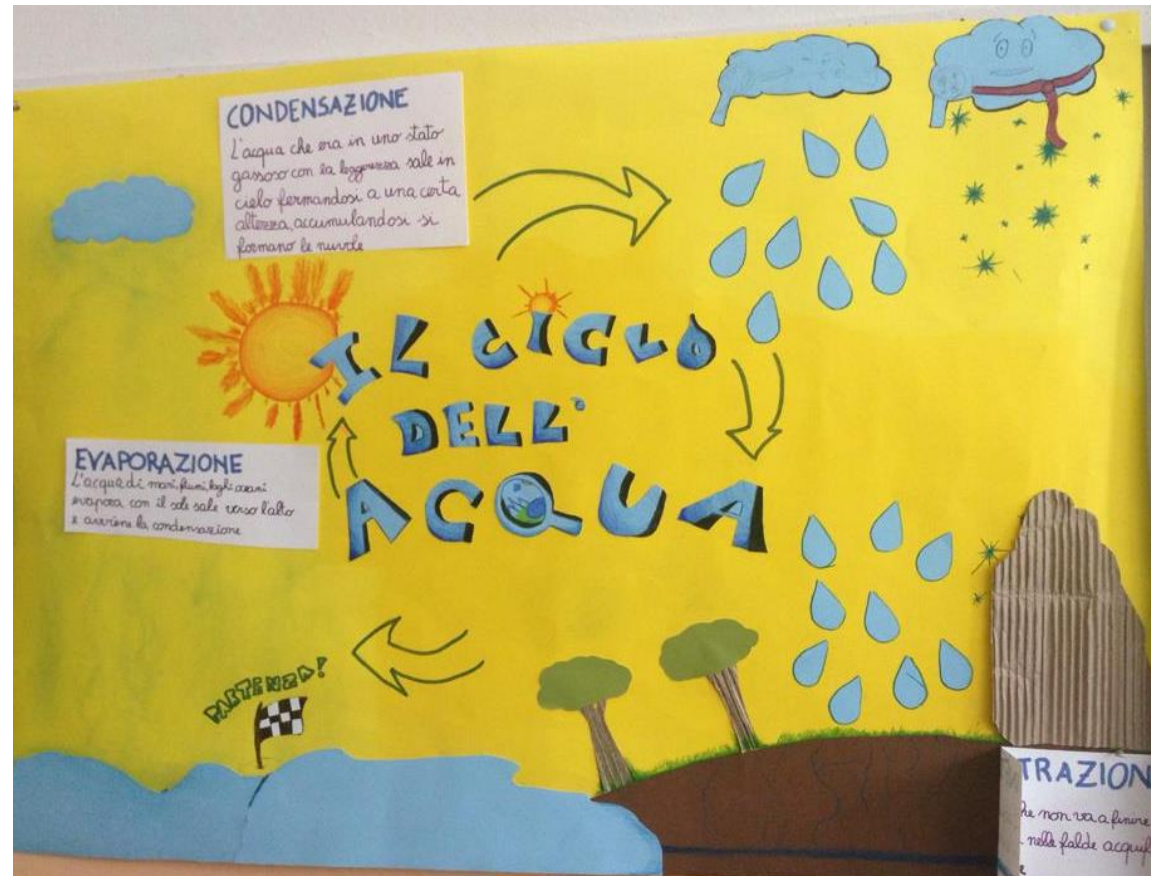

We used in our researches not only books, but also modern devices like smartphones.

Making posters

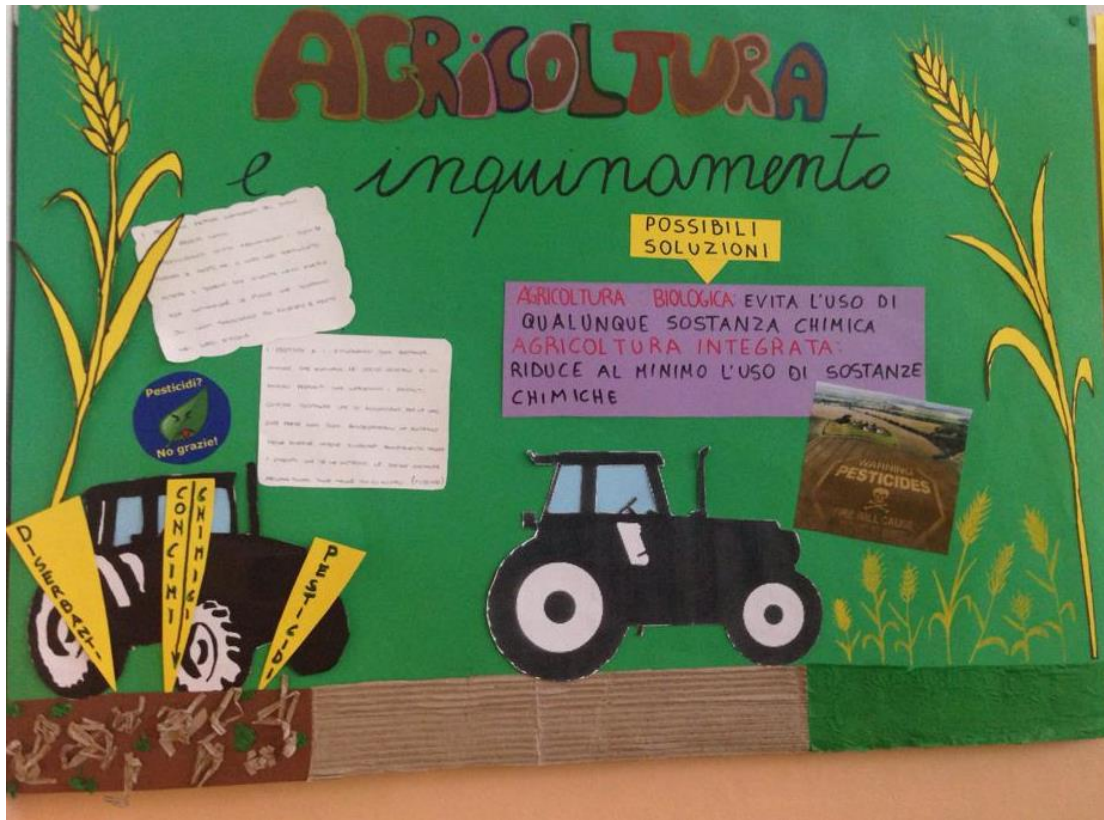

Making posters took a lot of time..., but children learn only by doing

The water cycle

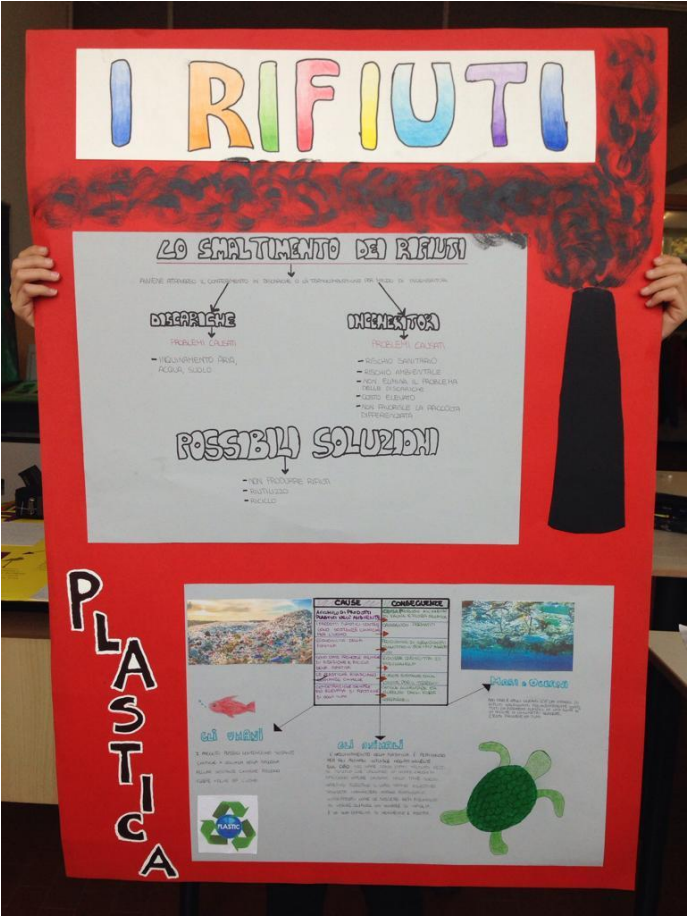

A group studied the water cycle

Industrial waste and chemical fertilizers

Industrial waste and chemical fertilizers are two of the major causes of the water pollution

Household waste and means of transport

Also household waste and means of transport (think about accidental oil leakage) are causes of water pollution

Lifestyles

This is in my opinion the most important poster because children understand that if they change their lifestyle they can save our planet
